Estate Centric

CRM User Manual

A practical guide for managing leads, teams, projects, inventory, properties, maps, reports, and customer follow-up.

Guide at a glance	What you will learn
Audience	Sales teams, property teams, managers, and workspace administrators
Core workflow	Capture -> assign -> follow up -> visit -> offer -> booking -> collections
Admin focus	Users, invites, roles, permissions, plans, integrations, and backups

Version 1.0 | November 2026

1. Quick start

Estate Centric is organized around a simple sales and property workflow. Start with the steps below before exploring advanced setup.

- Sign in. Use your workspace email and password. If your administrator sends an invite, open the one-time link and create your password first.

- Set your profile. Open your profile/avatar area and confirm your name, phone, password, and two-factor method.

- Learn your scope. Your role controls which leads, contacts, reports, and actions you can see. If something is missing, ask an administrator to check your role and branch/team.

- Work from the lead record. Every call, note, follow-up, visit, offer, and booking should be recorded on the lead timeline.

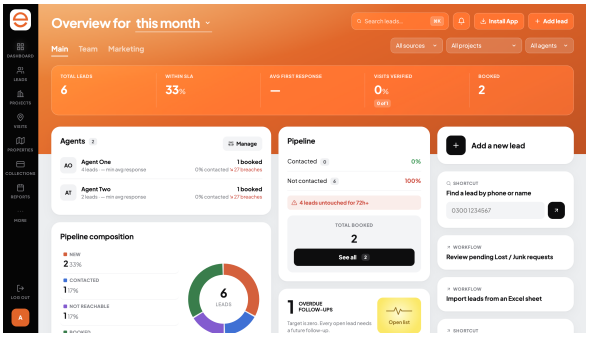

Recommended first-day checklist

Task	Owner	Done when...
Confirm phone and profile	Every user	Your contact details are correct
Review assigned leads	Agent / counsellor	Each open lead has a next action
Check dashboard and reports	Team lead / manager	You know today's overdue and SLA items
Invite teammates	Admin	Each teammate has a role, team, branch, and invite link

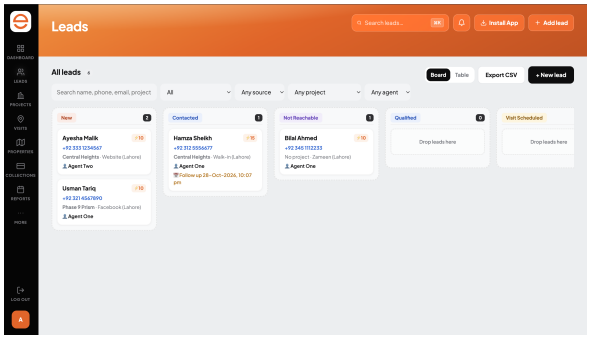

Important: Estate Centric records business activity for accountability. Keep statuses, notes, follow-up dates, and ownership up to date.

Screen tour

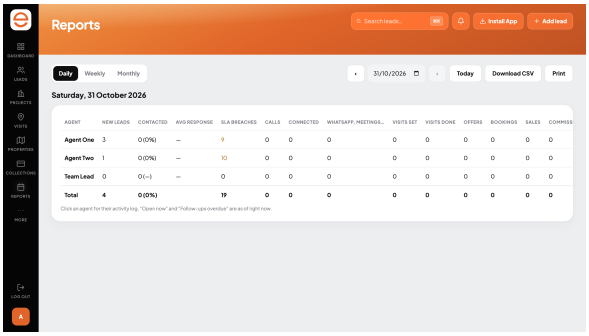

These screens show where the main workflows live. Your workspace may show additional modules depending on your role, plan, and enabled products.

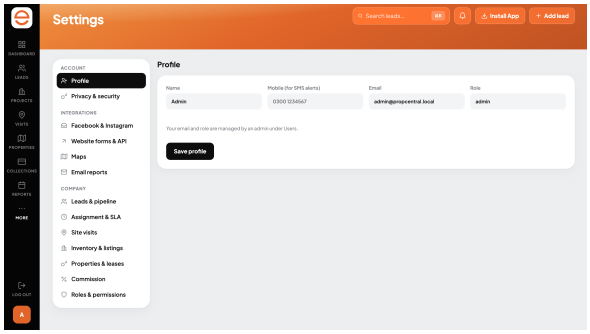

Dashboard: start here for KPIs, pipeline, agent activity, and overdue work.

Leads: manage the pipeline, search, filters, imports, and exports.

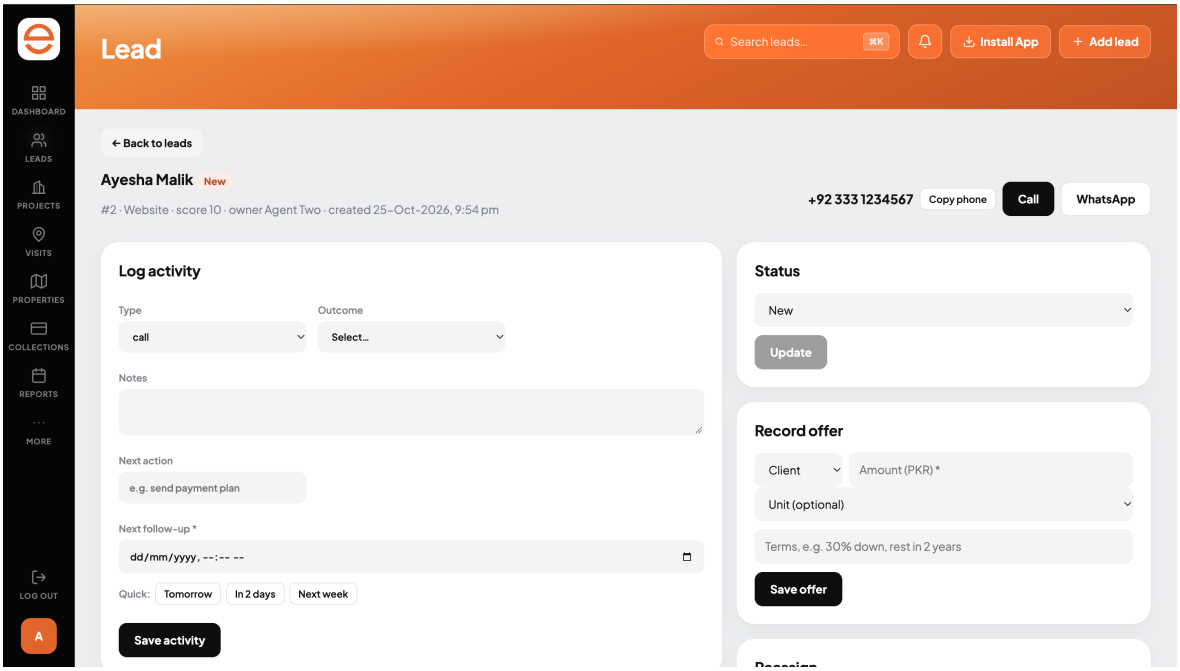

Reports: review daily, weekly, and monthly team performance.

Settings: configure profile, integrations, maps, roles, and permissions.

Screen tour: lead detail

The lead detail page is the source of truth for customer history and next actions.

Lead detail example: log activity, update status, set the next action, and keep the record owner and customer contact visible.

Tip: when handing a lead to another teammate, leave a clear note explaining the customer need, last conversation, promised follow-up, and any documents still needed.

Module-by-module guide

Use this section as the practical training path. Open the module shown in the left navigation, complete the action, and save the record before moving on.

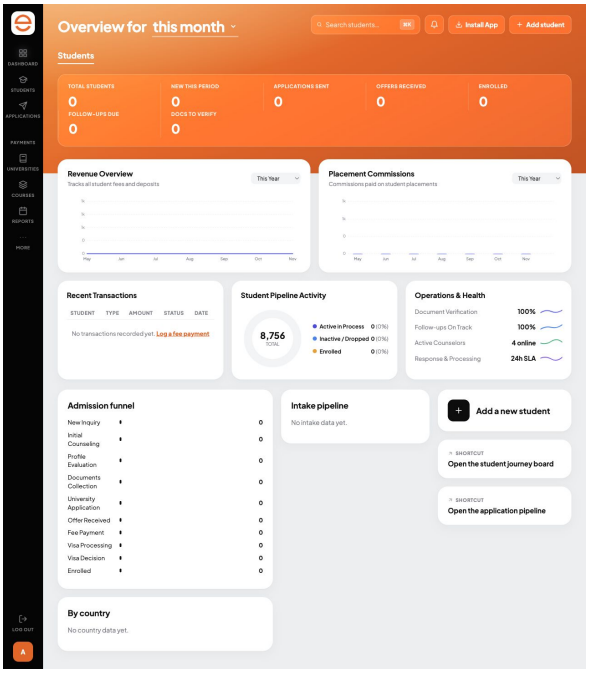

Module	What the user does	Main result
Dashboard	Review KPIs, overdue work, pipeline, and team activity	Know what needs attention today
Leads / Lead detail	Create, qualify, assign, contact, and schedule next action	Every opportunity has an owner and next step
Projects / Inventory	Maintain projects, phases, blocks, units, pricing, holds, and bookings	Availability and booking status stay current
Properties / Maps	Draw boundaries, upload overlays, place properties, and manage leases	Map and property records remain aligned
Visits	Schedule, check in, record feedback, and close the visit	Visits become measurable sales activity
Collections / Payments	Record receipts, installments, rent, refunds, and owner payouts	Financial history is auditable
Reports	Filter daily, weekly, or monthly performance and export approved reports	Managers can act on reliable numbers
Users / Settings	Invite users, set roles, permissions, integrations, and security	Access follows the company structure
Education modules	Manage students, applications, universities, courses, and payments	Admissions work follows one student journey
Therapy modules	Manage children, skills, knowledge, organization, and clinical workflow	Care work stays structured and permissioned

Screenshot note

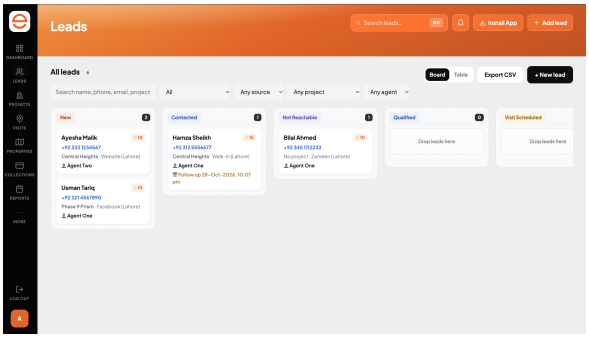

Screens are captured from the current Estate Centric interface. Menu visibility depends on the account modules and role; a user may see fewer modules than the full manual.

Module screens: property CRM

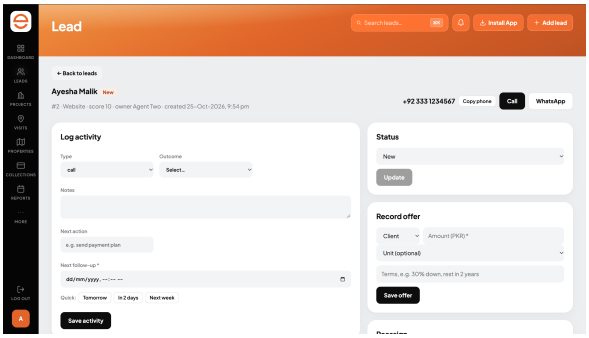

These screens cover the core real-estate workflow from daily overview through map and administration.

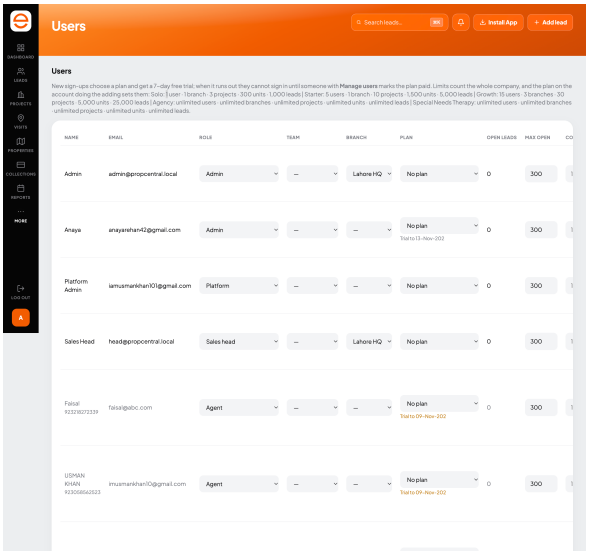

Dashboard: review the daily pulse, overdue items, funnel, and agent activity.

Leads: filter the pipeline, update status, and open a lead record.

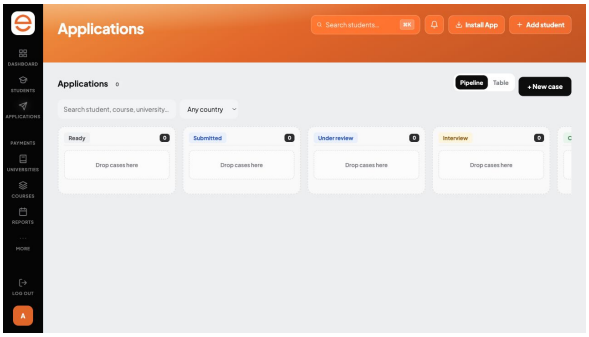

Lead detail: record calls, notes, status, offer information, and the next action.

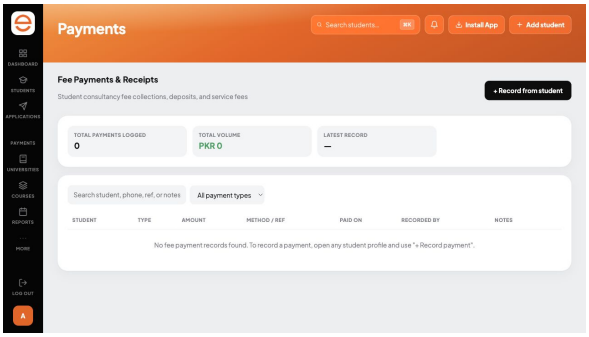

Users: assign roles, teams, branches, plans, and account access.

Module screens: education CRM

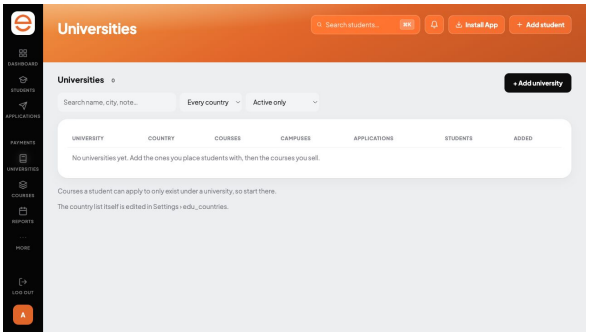

Education workspaces use a separate admissions journey. Keep student records, applications, payments, universities, and courses connected.

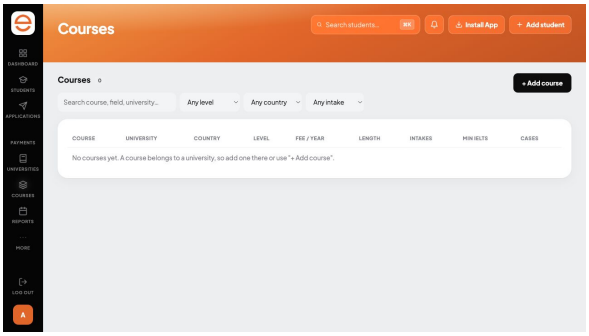

Applications: track application status, intake, documents, offers, and visa stages.

Payments: record payment type, amount, method, receipts, and outstanding balance.

Universities: maintain destination institutions and the countries they serve.

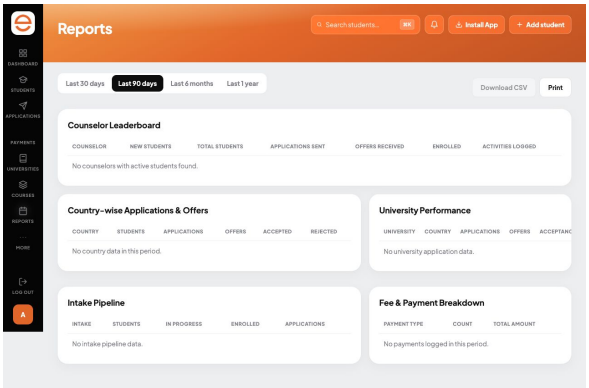

Courses: maintain course options used while preparing applications.

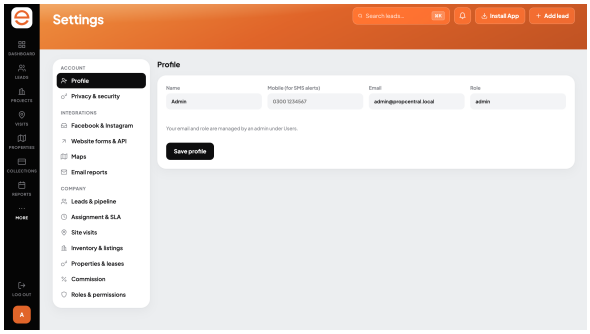

Education sequence: create the student -> complete profile and document checklist -> create one or more applications -> track offer and visa outcomes -> record payments -> mark enrolled.

Module screens: operations and management

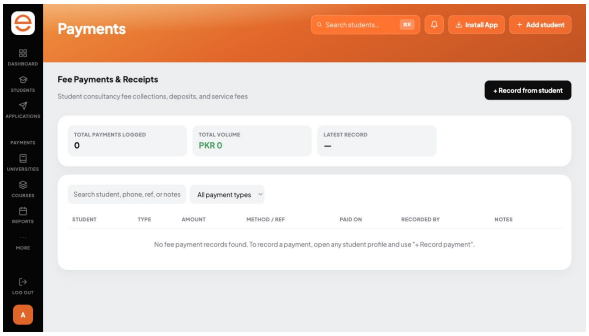

Managers use these screens to monitor performance, configure access, and keep the workspace safe.

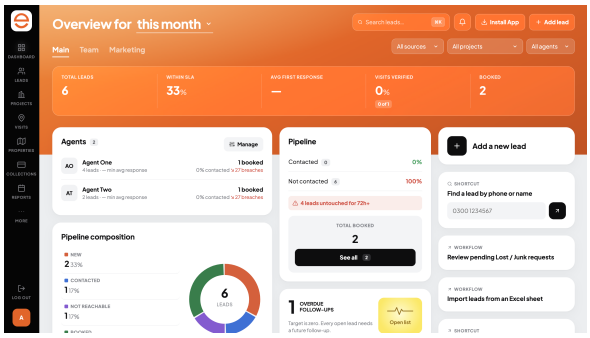

Reports: switch daily/weekly/monthly views, review team rows, and use approved export/print actions.

Settings: configure profile, integrations, maps, permissions, and system rules.

Collections reference: confirm receipt workflow and balance collection before closing a financial item.

Management dashboard: use KPIs to choose the next coaching or follow-up action.

For Properties, Projects, Visits, Collections, and Therapy, use the step-by-step instructions in the next chapters. These modules are permission-gated, so the exact menu appears only when enabled for the account.

2. Navigation and permissions

The left navigation changes according to your enabled modules and permissions.

Area	Use it for
Dashboard	KPI summary, funnel, response time, sources, agents, visits, and overdue work
Leads	Board/table pipeline, search, assignments, activities, imports, and exports
Properties	Societies, boundaries, rental properties, leases, rent, maintenance, and owner statements
Projects / inventory	Projects, phases, blocks, units, pricing, holds, allotments, and map inventory
Visits	Schedule, check-in, customer OTP, feedback, and unverified visits
Reports	Agent performance, sales, collections, commissions, and print/CSV output
Settings	Company rules, integrations, maps, roles, permissions, reports, and security

Role model

- **Role:** controls lead visibility and available actions. Common roles include Agent, Team lead, Branch manager, Sales head, Owner, and Admin.

- **Team and branch:** refine assignment and reporting scope. Keep them accurate so routing and reports remain reliable.

- **Permission matrix:** administrators can decide which roles may import, export, manage users, edit inventory, approve lost leads, manage payments, and change settings.

If you cannot see a menu item or button, it is usually a permission, module, plan, or account-scope setting - not a browser problem.

3. Leads: the daily operating workflow

Leads are the center of the CRM. Keep the record complete so the next person can understand the customer and take action.

Create and qualify a lead

- Select **Leads**, then choose **+ New lead**. Capture name, phone, source, project, budget, purpose, and any custom fields.

- Search before creating a duplicate. The CRM normalizes phone numbers and can attach repeat inquiries to an existing open lead.

- Assign the lead to the correct agent or let the assignment rules route it by source, city, project, budget, team, branch, working hours, or load.

- Set a next follow-up date for every active lead. The SLA clock uses first-contact and follow-up activity to surface risk.

Lead status discipline

When this is true	Use this action
New inquiry received	Keep New and make the first contact
Conversation started	Log a call/note and move to Contacted
Customer is a fit	Move to Qualified and record needs/budget
Visit or meeting is agreed	Create a Visit with location and time
Offer or price discussion started	Record an Offer and keep next action current
No further opportunity	Use Lost/Junk with a reason; approvals may be required

Import and export

- Use **Import leads** for CSV/XLSX files. Start with a dry run to review duplicates, invalid rows, and fields before committing.

- Use CSV or XLSX export only when your role has permission. Export requests may require approval from a sales head or administrator.

- Protect downloaded files: they contain customer data and may be watermarked or audited.

4. Users, invites, roles, and permissions

Administrators should manage access through invitations and roles instead of sharing passwords.

Invite a user

- Open **Users** and choose **Invite user** / **Create account**. Enter name, email, phone, role, team, and branch.

- Leave the password blank to generate an invitation. The user receives a one-time setup link when email delivery is configured.

- If email is not configured, copy the generated invite link and send it through an approved channel. The link expires after 30 minutes and works once.

- Use **Invite link** on an existing user to generate a fresh setup link. Deactivated users must be activated first.

Assign the right access

Role	Typical use
Agent	Own leads, calls, visits, offers, and assigned follow-ups
Team lead	Team visibility, coaching, assignment support, and approvals available to the role
Branch manager	Branch-level visibility and operational reporting
Sales head / Owner	Company-wide sales oversight and approval workflows
Admin	Users, settings, permissions, integrations, and full workspace administration

Account isolation

Users, projects, properties, overlays, and other account-owned records are scoped to the workspace that created them. A user added under the main account inherits the company workspace and its enabled modules; unrelated accounts do not appear in the Users page.

Security rule: never send a password in a shared spreadsheet or chat. Use the one-time invite/reset link.

5. Projects, inventory, and maps

Use Projects for land/building inventory and Properties for managed real estate and map-based property work.

Project inventory workflow

- Create the project, then add phases, blocks, streets, units, pricing, categories, and premiums.

- Use the inventory map to view live unit status. Holds expire automatically according to your settings.

- When a booking is created, the unit status and lead status update together. Keep the customer ledger and allotment documents attached.

- Use media for brochures, floor plans, photos, and shareable project links.

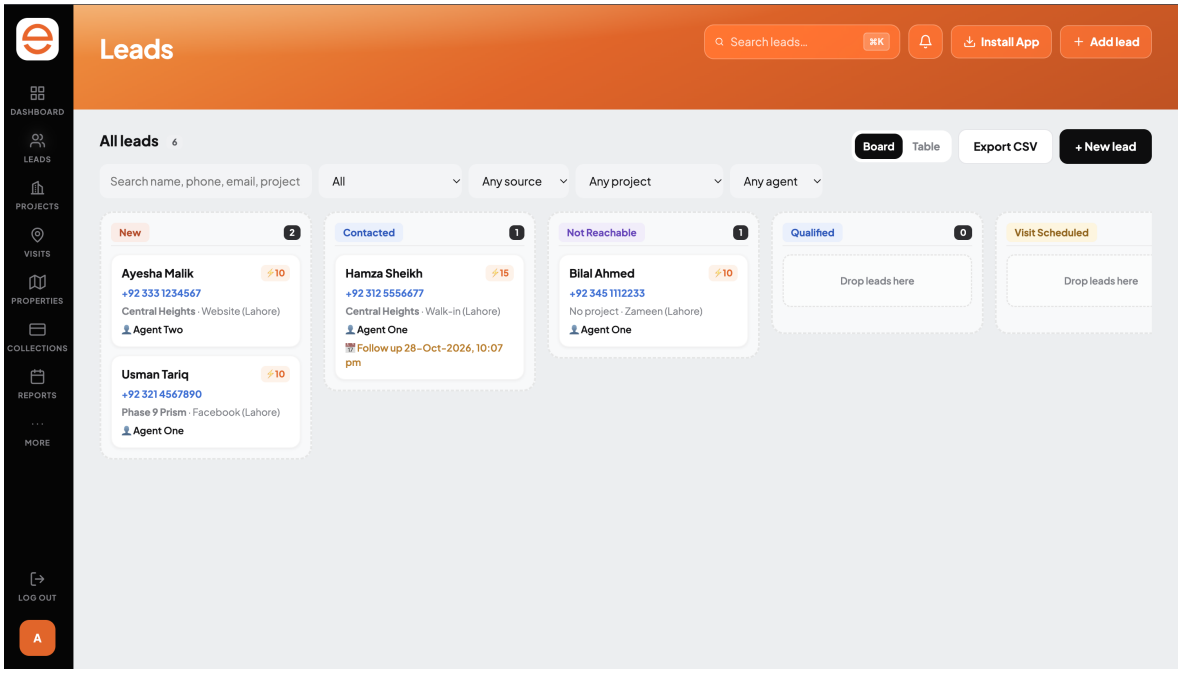

Society and property map workflow

- Open **Properties -> Societies** and draw or edit the society/phase/block boundary.

- Click the map to add a property pin. The CRM determines the containing society/phase/block when the point falls inside a boundary.

- Upload a plan image, remove white background when needed, adjust opacity, fit the map, match points, and redraw boundaries when the outline is incorrect.

- Click the uploaded map to open the overlay controls. Use Hide map, Reset position, Fit entire map, Redraw boundary, and Delete carefully.

Example interface view - the Leads board shows status columns, filters, search, and export controls.

6. Properties, collections, and reports

The property and collections tools keep ownership, leases, rent, payments, and sales performance together.

Managed property workflow

- Create or select a society, then add the property from the map with owner and tenant details.
- Create the lease with rent, deposit, dates, yearly increase, police registration, and agreement number.
- Review rent schedule and overdue items from the property or Collections area. Record receipts, refunds, maintenance, and owner payouts.
- Use status colours on the map to identify vacant, let, ending, or overdue properties.

Reports

Report	Best used for
Dashboard	Daily pulse: funnel, SLA, source, agent, visit, and overdue indicators
Agent report	Daily/weekly/monthly productivity, response time, calls, visits, bookings, sales, and commission
Collections	Overdue rent, installment plans, receipts, payments, refunds, and transfers
Commissions	Pending, paid, cancelled, dealer balances, and agent targets
Weekly email report	Management summary; configure in Settings when email delivery is connected

7. Integrations and data capture

Connect the channels your team already uses, then confirm every inbound record is visible in the CRM.

Facebook and Instagram leads

- Open **Settings -> Facebook & Instagram** and enter the Meta app details, verification token, app secret, and Page token as configured by your administrator.

- Confirm the webhook callback and test delivery. Campaign, ad set, and ad identifiers are stored with the lead when provided by Meta.

- Review recent deliveries in Settings. A rejected lead should show a reason rather than failing silently.

Website and inbound API

- Use Settings -> Website forms & API for the inbound endpoint and API key.

- Send a name plus at least one contact method, then include source, campaign, project, budget, and notes when available.

- Treat inbound keys like passwords. Rotate them if they are exposed.

Email and SMS expectations

Some installations use console stubs until an SMTP/email API or local SMS gateway is connected. If an invite link is generated but email is not marked as sent, copy the link and deliver it manually while the integration is being configured.

8. Security, backups, and troubleshooting

Good data hygiene protects customer information and prevents operational confusion.

Security checklist

- Use a unique password with at least 10 characters and letters plus numbers.
- Enable two-factor login from your security settings. Administrators can reset 2FA for a user who loses access.
- Deactivate offboarded users promptly. Their sessions end and open leads can be reassigned.
- Do not share exports, invite links, API keys, customer CNICs, or portal links outside approved channels.
- Use workspace backups for one company and full database backups only for platform administrators.

Common problems

Problem	What to check
Cannot see a lead or property	Role scope, branch/team, account, active status, and module permissions
Invite email did not arrive	Email integration, spam folder, correct address; copy the one-time link from Users
Map overlay looks cut or misaligned	Fit entire map, reset position, opacity, white-background option, match points, redraw boundary
3D or map view does not load	Browser refresh, MapTiler key, deployment API health, and browser console/network errors
Import rejects rows	Run dry-run first; correct required fields, phone format, duplicate rows, and headers
User sees the wrong role	Refresh session, check Users role dropdown, verify account owner, and log in again

Deployment check

Administrators can check **/api/health** after deployment. A healthy response confirms the API and database connection. If the response is a 500, inspect the deployment environment variables and database credentials before changing application data.

Appendix: recommended operating rhythm

Frequency	Team habit
Every morning	Review dashboard, overdue follow-ups, new leads, visits, and assignments
After every contact	Log the activity, result, next action, and next action date
Before a visit	Confirm location, customer phone, assigned agent, and visit status
After an offer	Record amount, terms, documents, and the next decision date
At booking	Confirm unit status, allotment, payment plan, receipt, and customer documents
Every week	Review SLA breaches, source quality, agent response time, lost reasons, and collections
Every month	Review commissions, targets, branch performance, plan limits, users, and backups

Need help?

Contact your Estate Centric workspace administrator first. Include the page, user email, approximate time, and a screenshot of the issue. Never include passwords, API keys, or private customer documents in a support request.

Estate Centric - turning property conversations into accountable workflows.
